Element Hunter X (EHX) is an application which allows you to maintain a single browser session while testing elements for web automation testing. It's main purpose is to save time from recompiling and/or relaunching test from your code and waiting over and over for the browser to open and close.

Main Window

Within the main window there are two sections:

1. Browser Configuration
2. Element Configuration

Browser Configuration:

Within Browser Configuration there are three actionable interactions:

1. **URL:** A text input box where you can paste the URL you will be testing.
2. **Browser:** A drop down list of browsers. Choose the one you'd like to open the URL with.
3. **Launch Button:** Once the previous inputs have been completed, click the rocket ship to launch the browser to the URL chosen.

Element Configuration:

Within Element Configuration there are four actionable interactions:

1. **Element String:** Text input box where you can paste or type your element tag string (i.e. CSS, XPATH, or ID).
2. **Element Type:** A drop down where you will choose the type of element that you have pasted or typed above.
3. **Color:** A color drop down where you can choose a color of which will be highlighted within the browser.
4. **Highlight Button:** Once the previous inputs have been completed, click the rocket ship to launch the browser to the URL chosen.

Note:

- If there is an error in highlighting the element within the browser, an error pop up will notify you. Try changing the element tag string to one that works.
- Once you see that the element is highlighted, you know that element will work within your scripts.
